1. Course Code

2292

2. Course Title

Embedded System

3. Teacher

MARKON, Sandor

4. Term

Spring 2

5. Course Overview and Objectives

An important area of programming for both developed and developing countries is using embedded systems, also called dedicated computers, or IoT (Internet of Things), that can help solving a wide range of technical and social issues. Some examples include wireless sensor networks for remote data collection or disaster prevention, RFID for inventory control, human body sensors for remote medicine etc. When compared to common PCs, embedded systems use different hardware and software platforms, and to use them require understanding of special concepts like direct hardware I/O (input-output), interrupts, real-time control, cross-development environments etc.

By finishing this course, the student will be able to recognize opportunities of effectively using embedded systems to solve ICT4D issues, and to propose and initiate projects, based on concrete experience with embedded systems.

6. Course Goals (Attainment Targets)

- (1) Become able to recognize suitable application areas and make proper choices for embedded systems.
- (2) Become able to design for reliability, maintainability, safety, and security in developing embedded systems.
- (3) Can develop for an embedded platform and use its development environment.
- (4) Can develop programs with embedded concepts like hardware control, sensors, actuators, timers, interrupts etc., through hands-on experience.
- (5) Find and solve a development problem using embedded systems.

(6)

7. Correspondence relationship between Educational goals and Course goals

	Course Goals		
High level ICT		(1) (2)	
skills	Specialized knowledge	(3) (4) (5)	
Human skill (Tankyu skill)	Ability to continually im	(2)	
	Ability to discover and resolve the problem in society	Problem setting	(5)
		r typotitiesis piaritiitig	
		Hypothesis testing	
		Practice	
	Fundamental	Ability to step forward	(5)
	Competencies for	Ability to think through	
	Working Persons	Ability to work in a tear	(5)
Professional	•		

8. Course Requirements (Courses / Knowledge prerequisite for this course)

Fundamentals of Computer Programming

9. Textbooks (Required Books for this course)

None. This course uses only material freely available on the Internet (links will be provided on Moodle).

10. Reference Books (optional books for further study)

None

11. Evaluation

Goals	Evaluation method & point allocation							
	examination	Quiz	Reports	Presentation	Deliverables	Other		
(1)			0					
(2)				0	0			
(3)			0	0	0			
(4)			0	0	0			
(5)				0	0			
(6)								
Allocation			30	30	40			

12. Notes

Students not comfortable with basic electric circuit concepts (currents and voltages, Ohm's law etc.) are advised to take part in voluntary lab sessions before taking the course.

13. Course plan

(Notice) This plan is tentative and might be changed at the time of delivery

Lesson 1: Orientation and Introduction

(lecture and demonstration, 90min)

Review through examples the basic concepts of embedded systems, from TV remote controls and rice cookers to airplane controls and power plants; the reasons for using them, principles, problems, evolution, and current status. Explain the course plan: discussions, practice, work group forming, projects, evaluation, and further studies. Students are shown some of the devices used in the course.

Lesson 2: Motivation by Examples

(lecture and group discussion, 90min)

Introduce examples of embedded systems in products and services through case studies. Student groups are formed, and based on understanding some typical applications, discuss other uses in fields familiar to them, listing up possible project topics, analyzing their merits and difficulties, their novelty, feasibility, profitability and sustainability.

Student groups start their discussions on their project topic.

Lesson 3: Platforms (a) - Arduino

(practice, presentations, 90min)

Students learn to develop a simple application using the open source / open hardware Arduino platform as an example of working with a simple stand-alone embedded environment. Groups receive sets of Arduino boards, sensor and actuator devices, and after installing the development environment on their PCs, design, program, and test a simple embedded application according to the provided requirement specifications.

Student groups present their project proposals with Tankyu charts and overall plans.

Lesson 4: Platforms (a) - Arduino

(continued, 90min)

Student groups review the possibilities available with the provided hardware and software tools, and compete to design the most surprising embedded application with their resources on Arduino.

Lesson 5: Review of embedded concepts (1)

(lecture and group discussion, 90min)

Starting from their experience with the Arduino board, student groups discuss basic embedded system concepts, reviewing and analyzing the handling of I/O devices, timings, process flow etc. Motivation is given for searching for more advanced capabilities like interrupts, multi-threading, guaranteed real-time response etc.

Lesson 6: Platforms (b) - Raspberry Pi

(practice, 90min)

Student groups receive Raspberry Pi boards and install Linux on them. By connecting them to the network, they learn how to use such a self-development environment on a small embedded platform. Students also discuss common features and differences between the Raspberry Pi and the Arduino environment, and try to find out advantages and limitations through reading the documentation and performing experiments.

Lesson 7: Platforms (b) - Raspberry Pi

(continued, 90min)

Student groups re-build their Raspberry Pi Linux OS from source, and add a new device driver, file system, or other extra capability of their choice that was not present in the original distribution. Discuss the experience from the point of view of open source vs. proprietary systems.

Lesson 8: Review of embedded concepts (2)

(lecture and group discussion, 90min)

Starting from their experience with the Raspberry Pi board, student groups discuss using an operating system like Linux for embedded systems, reviewing the advantages and drawbacks of isolating the hardware from the application, and of providing basic development capabilities on the deployed embedded system itself. Soft- and hard real-time OS concepts will be introduced here.

Lesson 9: Mid-term project review

(presentations, mid-term exam, 90min)

Student groups present the progress of their embedded application projects, reviewing their current status and roadmap. Different groups share their experiences and exchange advices.

Lesson 10: Review of embedded concepts (3)

(lecture and group discussion, 90min)

Students review and compare the platforms that they have explored, and develop their own guidelines for choosing the proper environment for different applications. These will consider not only technical features, but also economic and social factors, IP issues, job creation, long-term local sustainability etc.

Lesson 11: Workshop: IoT (1)

(lecture and group discussion, 90min)

Visiting lecturers from ICTP introduce the concept of Internet of Things (IoT) and its role in developing countries, through examples from their practice.

Lesson 12: Workshop: IoT (2)

(lecture and group discussion, 90min)

Visiting lecturers demonstrate and explain using the new embedded platform "PYCOM" for IoT. Student groups explore creating and operating WSN using the provided equipment, and review their project topic in light of what they have learnt about IoT.

Lesson 13: Workshop: IoT (3)

(lecture and group discussion, 90min)

Student groups discuss their ideas and application areas for IoT with visiting lecturers, and review their experience with experiments on Arduino and various sensors.

Lesson 14: Workshop: IoT topics for developing countries

(lecture and group discussion, 90min)

Visiting lecturers review currently important Internet of Things topics for developing countries, including TV White Spaces, Delay Tolerant Networks (DTN) and successful applications of WSN.

Lesson 15: Final project review

(presentations, 90min)

Each group presents its project results, demonstrating the device and system they have built, explaining how it will solve an actual problem of development, how it can be put into practice, and how can its effects be evaluated and verified. Each team member takes part in the presentations in turn.
